MAR 15 2005

Subject: Bloomington Substation  
2700 East 80<sup>th</sup> Street  
Bloomington, Minnesota

Dear Mr. Koplitz:

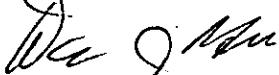

Please find enclosed the Development Response Action Plan Implementation Report for the above referenced site. Copies of these reports have also been submitted to the VIC Program for review due to the presence and removal of non-petroleum related impacts to surficial soil.

We would like an expedited technical review in order to meet an April 1<sup>st</sup> site closure and grading initiation deadline. This work needs to be initiated by April 1<sup>st</sup> in order to meet the FAA deadline for opening of the new runway. We are also requesting a file closure determination be considered for low-level, residual petroleum-related compounds in the near-surface soil at the site.

If you have any questions in the meantime, please feel free to call me at 763-786-1445.

Sincerely,

**ProSource Technologies, Inc.**

David J. Hodek, P.E.  
Project Engineer

cc: Mr. Al Peterson

## 1.0 INTRODUCTION

On behalf of Northern States Power Company (d.b.a. Xcel Energy), ProSource Technologies, Inc. (ProSource) has prepared this Development Response Action Plan (DRAP) Implementation Report for the Bloomington Substation located at 2700 East 80<sup>th</sup> Street in Bloomington, Minnesota (hereon referred to as "Site"). The purpose of the response actions was to assist Xcel Energy with environmental issues related to the sale of its property to the Metropolitan Airports Commission (MAC).

### 1.1 Site Description

A site location map using the United States Geological Survey (USGS) St. Paul SW 7.5 minute topographic quadrangle base map is provided as Figure 1. The USGS coordinates for the site are the NW ¼ of the NE ¼ of Section 1, Township 27 North and Range 24 West within Hennepin County, Minnesota.

The Site was a rectangular piece of land approximately two acres in size and located southeast of the intersection of Interstate Highway 494 and 24<sup>th</sup> Avenue South. The Site was an electrical substation with five single-story control house buildings, two large transformers, seven vacuum switches, a gas-filled circuit breaker, and two large transmission towers. The remainder of the Site was gravel covered with some perimeter grasses, trees, and shrubs. A site map is included as Figure 2.

### 1.2 Site History

The Site was developed from farmland by the McCarthy Well Company in the mid-1960's and owned until 1986. In 1986, Xcel Energy acquired the Site by eminent domain in order to build an electrical substation to provide electrical service to the nearby Mall of America. The construction of the existing electrical substation was completed in 1987. The Site was recently acquired by the Metropolitan Airports Commission from Xcel Energy.

### 1.3 Previous Investigations

A Phase I ESA was conducted at the Site in June 2000 and updated in 2004 by ProSource. The Phase I ESA identified the areas surrounding two large transformers at the east and west sides of the Site as potential areas of concern. Absorbent materials were observed on the concrete pads below the transformers and evidence of permanent staining of the concrete pads was also observed.

To further define the extent of these impacts, a Phase II ESA was completed in September 2004 in accordance with the Phase II Investigation Work Plan approved by the MPCA on August 3, 2004. The Phase II Investigation indicated two locations of surficial soil staining adjacent to a transformer pad and a tower foundation. Analytical results from these two locations also indicated elevated levels of DRO at 330 mg/kg near the tower foundation and at 890 mg/kg near the transformer pad.

#### 1.4 Project Objectives

Specifically, this Report outlines the procedures and methods used to screen soil at the Site, sampling procedures and results, and disposal of impacted soil and concrete in order to accommodate the planned future land use as buffer property for MAC's runway expansion project. Ultimately, the purpose of this document is to fulfill MPCA VIC and VPIC program requirements and to achieve a "No Further Action" and "File Closure" letter.

## 2.0 RESPONSE ACTIONS

Response actions at the Site were undertaken December 6-7, 2004 with soil excavation and concrete removal performed by Xcel Energy. Activities were performed in accordance with the DRAP and the Construction Contingency Plan (CCP) approved by the MPCA VIC Program.

The soil cleanup activities at the Site included the removal of impacted soil from the vicinity of the transformer pad and the tower foundation. In addition, stained concrete from these two locations was also removed for disposal. Excavation areas are depicted on Figure 2. The following sections detail the cleanup activities associated with implementation of the response actions.

### 2.1 Site Preparation

Prior to starting work, all underground utilities were cleared through the Gopher One-Call service. ProSource also prepared a Health and Safety Plan (HASP) which all on-site personnel were required to read and sign prior to the start of work. All work was completed in Level D personal protective equipment (ppe). Air monitoring was conducted using a photoionization detector (PID).

### 2.2 Excavation, Trucking, and Disposal

ProSource field staff was on-site to supervise and direct field activities. To ensure the health and safety of on-site personnel, air monitoring was conducted using a PID. Organic vapor concentrations in the ambient air above background levels were not observed. Fugitive dust was controlled and noise, odors, and off-site tracking were minimized to the extent possible.

Excavation of impacted soil was conducted using a backhoe and began once the stained concrete was chipped from the transformer pad and tower foundation. Depth of the excavation near the transformer pad ranged from approximately one to two feet below grade while the excavation near the tower foundation reached a depth of  $\frac{1}{2}$ -foot. Due to the lack of elevated organic vapor concentrations in the soil, the excavation was advanced based primarily on visual observations. Once it had been determined that soil was free of visual staining and elevated organic vapor concentrations it was directly loaded into the rolloff container for off-site disposal.

Approximately 10 cubic yards of contaminated soil and stained concrete were transported to SKB Rosemount Industrial Waste Facility in Rosemount, Minnesota for disposal. Disposal records are included in Appendix A.

### 2.3 Confirmatory Sampling

Due to the shallow depth of the tower foundation excavation, sidewall samples for headspace screening were not collected. Samples were screened for organic vapors on  $\frac{1}{2}$ -foot intervals using a photoionization detector (PID). Headspace screening results are summarized on Table 1 with sampling locations depicted on Figure 2.

Once it had been determined that soil was free of visual staining and elevated organic vapor concentrations, confirmatory samples were collected from the excavation base and sidewalls in the transformer pad excavation and from the base of the tower foundation excavation. Samples were analyzed by En Chem, Inc. in Green Bay, Wisconsin for Benzene, Toluene, Ethylbenzene, Toluene (BTEX); Semi-Volatile Organic Compounds (SVOCs); Polychlorinated Biphenyls (PCBs); and Diesel Range Organics (DRO). Samples for BTEX, DRO, and PCB analysis were collected from all sampling locations while one sample for SVOC analysis was collected from each excavation base. Confirmatory sampling locations are shown on Figure 2.

### **2.3.1 Confirmatory Sampling Procedures**

Soil samples for headspace screening were sealed in clean, Ziploc® bags and placed in a warm environment to allow organic vapors to develop. Soil samples were screened for organic vapors using a PID calibrated on a daily basis to an isobutylene standard.

Soil samples for laboratory analysis were field preserved (as required) and placed into clean, laboratory-supplied sample containers. Each sample container was uniquely numbered and labeled using indelible ink. Additional information on the label included the analytical parameters(s), preservatives(s), sampling personnel, date and time of sample collection and the project number. The label was then directly affixed to the appropriate sample container. Samples were placed on ice and maintained at a temperature of 4° C. A chain-of-custody was also initiated and kept with the samples until custody was relinquished to the laboratory.

A clean pair of latex or nitrile gloves was used at the onset of sampling activities at each new sampling point. Sampling personnel kept their hands as clean as practical and replaced gloves if they became soiled while performing sampling activities. Furthermore, sampling personnel took care not to touch the inside of sampling containers, inside of bottle caps, or the rim of sample containers. If contact occurred, sample containers were replaced. Care was also exercised to minimize the potential for airborne contamination of samples during collection.

### **2.3.2 Confirmatory Sampling Results**

PCBs, BTEX, and SVOCs were not detected in any of the confirmatory samples collected. DRO was detected above the laboratory's method detection limit at eight of the nine sampling locations with concentrations ranging from below detection limits to a high of 58 mg/kg at SWS-1 (1-foot). SRVs have not yet been established for DRO. Per the MPCA's Gasoline Range Organics and Diesel Range Organics Policy, December 2004, DRO concentrations are primarily used by the VIC Program as indicator parameters or the presence of SVOCs. While a SVOC sample was not collected from SWS-1, a sample was collected from B-1 which was approximately three feet from SWS-1 and also had a detection of DRO. SVOC concentrations did not exceed the laboratory's method detection limit in B-1.

While an SRV has not been established for DRO, according to the MPCA's Petroleum Remediation Program (PRP) Fact Sheet 3.02, the action level for DRO or GRO is 50 mg/kg in sand or gravel and 100 mg/kg in silt or clay. The DRO action level for sand or gravel was slightly exceeded only at

SWS-1 in the sample collected from 1-foot below ground surface. Confirmatory sampling results are summarized in Table 2. Laboratory analytical reports are included in Appendix B.

## 2.4 Site Construction

The current redevelopment plans call for use of the Site as a buffer property for the new runway to be built at the Minneapolis-St. Paul International Airport. Per the zoning ordinance and FAA regulations, construction of buildings on the Site will be prohibited. A road will be extended through the eastern portion of the site while the remainder of the property will be used as open space. Access to the Site will be strictly controlled. A fence will be erected around the runway protection zone and access will be limited only to a few authorized personnel.

Fill is expected to be added to the Site in order to complete a continuous slope from the northern boundary of the Site to the current ground surface at the southern boundary. Anticipated post-development topography at the Site is illustrated on Figure 3. Documents detailing the origin of the backfill to be used at the Site and/or a backfill sampling plan will be submitted with a No Association letter request by MAC immediately following submission of this report. Backfilling and grading activities will be summarized in the Annual Soil Management Report submitted to the MPCA by MAC as a requirement of their Soil Management Plan.

### 3.0 RECOMMENDATIONS AND CONCLUSIONS

The remedial actions succeeded in removing all visually stained soil and concrete from the Site. While DRO concentrations slightly exceeded the action levels at one of the sampling locations, SVOC concentrations were not detected in any of the confirmatory samples collected from the Site and organic vapor concentrations did not exceed background concentrations in the soil remaining in-place. As part of the Site's future development, the locations with elevated DRO concentrations will be covered with approximately two to three feet of clean fill, eliminating the direct contact pathway for exposure. In addition, access to the Site will be limited in accordance with FAA guidelines. This will eliminate the majority of human interaction with the Site.

Based on the nature of the release, the absence of DRO in shallow ground water at the Site, the removal of the source area soil, and the institutional controls, this site does not seem to pose a significant risk to human health or the environment. Therefore, we are proposing that a "No Further Action" letter and a "File Closure" letter be issued for the Site.

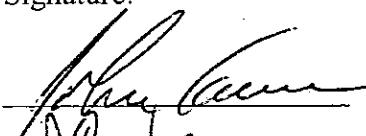

#### 4.0 CERTIFICATION

ProSource has prepared this DRAP Implementation Report for the exclusive use of Xcel Energy and their agents, for specific application to the Bloomington Substation Site located in Bloomington, Minnesota. The services performed by ProSource for this project have been conducted in a manner consistent with the level of skill and care ordinarily exercised by other members of the profession currently practicing in this area. No other warranty, expressed or implied, is made.

854309-001	DRO-S	B-1 2'	Late eluting hump along with diesel range peaks were present in the chromatogram.
854309-002	DRO-S	B-2 2'	Late eluting hump along with diesel range peaks were present in the chromatogram.
854309-003	BTEX-S-ME	B-5 0.5'	Sample received overweight (37.7 grams).
854309-003	DRO-S	B-5 0.5'	Late eluting hump along with diesel range peaks were present in the chromatogram.
854309-004	DRO-S	B-6 0.5'	Late eluting hump along with diesel range peaks were present in the chromatogram.
854309-006	BTEX-S-ME	SWS-1 1'	Sample received overweight (42.1 grams).
854309-006	DRO-S	SWS-1 1'	Late eluting hump along with diesel range peaks were present in the chromatogram.
854309-007	DRO-S	SWW-1 1'	Late eluting hump along with diesel range peaks were present in the chromatogram.
854309-008	BTEX-S-ME	SWE-1 1'	Sample received overweight (38.6 grams).
854309-008	DRO-S	SWE-1 1'	Late eluting hump along with diesel range peaks were present in the chromatogram.

## Qualifier Codes

Flag	Applies To	Explanation
A	Inorganic	Analyte is detected in the method blank. Method blank criteria is evaluated to the laboratory method detection limit. Additionally, method blank acceptance may be based on project specific criteria or determined from analyte concentrations in the sample and are evaluated on a sample by sample basis.
B	Inorganic	The analyte has been detected between the method detection limit and the reporting limit.
B	Organic	Analyte is present in the method blank. Method blank criteria is evaluated to the laboratory method detection limit. Additionally, method blank acceptance may be based on project specific criteria or determined from analyte concentrations in the sample and are evaluated on a sample by sample basis.
C	All	Elevated detection limit.
D	All	Analyte value from diluted analysis or surrogate result not applicable due to sample dilution.
E	Inorganic	Estimated concentration due to matrix interferences. During the metals analysis the serial dilution failed to meet the established control limits of 0-10%. The sample concentration is greater than 50 times the IDL for analysis done on the ICP or 100 times the IDL for analysis done on the ICP-MS. The result was flagged with the E qualifier to indicate that a physical interference was observed.
E	Organic	Analyte concentration exceeds calibration range.
F	Inorganic	Due to potential interferences for this analysis by Inductively Coupled Plasma techniques (SW-846 Method 6010), this analyte has been confirmed by and reported from an alternate method.
F	Organic	Surrogate results outside control criteria.
H	All	Preservation, extraction or analysis performed past holding time.
HF	Inorganic	This test is considered a field parameter, and the recommended holding time is 15 minutes from collection. The analysis was performed in the laboratory beyond the recommended holding time.
J	Inorganic	The analyte has been detected between the method detection limit and the reporting limit.
J	Organic	Concentration detected is greater than the method detection limit but less than the reporting limit.
K	Inorganic	Sample received unpreserved. Sample was either preserved at the time of receipt or at the time of sample preparation.
K	Organic	Detection limit may be elevated due to the presence of an unrequested analyte.
L	All	Elevated detection limit due to low sample volume.
M	Organic	Sample pH was greater than 2
N	All	Spiked sample recovery not within control limits.
O	Organic	Sample received overweight.
P	Organic	The relative percent difference between the two columns for detected concentrations was greater than 40%.
Q	All	The analyte has been detected between the limit of detection (LOD) and limit of quantitation (LOQ). The results are qualified due to the uncertainty of analyte concentrations within this range.
S	Organic	The relative percent difference between quantitation and confirmation columns exceeds internal quality control criteria. Because the result is unconfirmed, it has been reported as a non-detect with an elevated detection limit.
U	All	The analyte was not detected at or above the reporting limit.
V	All	Sample received with headspace.
W	All	A second aliquot of sample was analyzed from a container with headspace.
X	All	See Sample Narrative.
&	All	Laboratory Control Spike recovery not within control limits.
*	All	Precision not within control limits.
<	All	The analyte was not detected at or above the reporting limit.
1	Inorganic	Dissolved analyte or filtered analyte greater than total analyte; analyses passed QC based on precision criteria.
2	Inorganic	Dissolved analyte or filtered analyte greater than total analyte; analyses failed QC based on precision criteria.
3	Inorganic	BOD result is estimated due to the BOD blank exceeding the allowable oxygen depletion.
4	Inorganic	BOD duplicate precision not within control limits. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
5	Inorganic	BOD result is estimated due to insufficient oxygen depletion. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
6	Inorganic	BOD laboratory control sample not within control limits. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
7	Inorganic	BOD result is estimated due to complete oxygen depletion. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
