Appendix E	Details of Wild Rice Surveys on Swan Lake Southwest Bay and Swan River
Appendix F	Photographs of Wild Rice on Swan Lake Southwest Bay and Swan River (Swan River TBA)

# 1.0 Background

---

On October 11, 2007, Minnesota Steel Industries (Minnesota Steel) received a final air permit and authorization to construct and operate the reactivation of the former Butler Taconite mine and tailings basin area near Nashwauk, Minnesota and build a new processing facility to make sheet steel coils from the ore that is mined. In October 2007 Essar Steel purchased Minnesota Steel and formed Essar Steel Minnesota LLC (Essar). Since the purchase of Minnesota Steel, Essar has proposed modifications to increase its taconite pellet capacity to a nominal 6.5 million metric tons per year over a 15 year mining time period. The proposed modifications are referred to as the Essar Steel Minnesota Modifications Project. This increase in pellet production capacity will require 1) the installation of additional crushing and concentrating equipment, 2) a global standard sized indurating furnace, and 3) an increase in the rate of mining. The Department of Natural Resources (DNR) has concluded the proposed modifications require that a State Supplemental Environmental Impact Statement (Supplemental EIS) be prepared in accordance with Minnesota Rules 4410.3000 subpart 3A.

In the preparation notice for the Supplemental EIS, one of the issues identified for study is wild rice surveying and monitoring. This report has been developed to meet the needs of the SEIS as stated in the preparation notice, as follows:

*Wild Rice. Information on the current presence of wild rice in receiving water bodies from the ESML project will be identified and assessed. Changes to sulfate concentrations for affected water bodies will be modeled. This information will be used to identify potential impacts to wild rice in receiving waters due to changes in sulfate concentrations and/or water levels. Potential adverse environmental effects to water bodies will be identified and monitoring and/or mitigation will be developed to detect changes and to avoid and/or minimize impacts.*

This report contains the following information.

1. A summary of available 2009 and 2010 water quality and hydrologic monitoring data collected on Swan Lake;
2. Available literature review information to determine whether records of historical wild rice harvesting or cultivation exist, and if so to provide a summary of their contents;

3. Initial wild rice survey results to confirm the presence or absence of wild rice in lakes and bays downstream of the Proposed Project;
4. Wild rice survey data (stand size, density and plant height) for those water bodies identified to contain wild rice.

2010 water quality and wild rice monitoring results and information presented in this report were collected based on the technical memorandum entitled: “Essar Minnesota SEIS – Wild Rice Surveys and Water Quality Monitoring Protocol”, dated April 9, 2010; revised May 25, 2010 (Barr Engineering) (Wild Rice Study Protocol). Also presented in the report is the 2009 Swan Lake water quality monitoring data from the U. S. Steel Keetac Expansion project EIS.

Water bodies downstream of the Essar project include Swan Lake, Ox Hide Lake, O’Brien Lake, Snowball Lake, and Pickerel Creek (see Figure 1). No wild rice was found in Ox Hide Lake, O’Brien Lake, Snowball Lake, and Pickerel Creek (see Section 3.1 for additional details). In addition to the initial survey results, none of the historical records indicated the presence of wild rice on these water bodies. Per the approved protocol, water quality sampling was ceased and no wild rice counts were conducted on these water bodies following the initial wild rice survey. Water quality data and wild rice survey data for Swan Lake were collected. This report provides water quality data collected through August 11, 2010, as well as wild rice data collected in July and August. Water quality sampling will continue through 2010 until ice forms on Swan Lake. An updated report will be submitted following the completion of laboratory analyses of the last samples collected.

---

## 2.0 Water Quality Monitoring

Water quality and hydrologic monitoring are currently ongoing for 2010. Results of measurements collected through August 11, 2010 are presented in this report. A final water quality monitoring report will be generated after 2010 water quality monitoring activities are completed. The purpose of water quality monitoring is to evaluate the concentration of sulfate and corresponding basic water quality parameters (e.g., pH) in Swan Lake. Water quality monitoring activities for 2010 are scheduled to continue until ice formation on Swan Lake occurs (typically November or December). Water quality and hydrologic monitoring data were also collected biweekly by Essar on Ox Hide Lake, O'Brien Lake, Snowball Lake, and Pickerel Creek from June 24, 2010 through July 21, 2010. Essar ceased collecting this data following the completion of an initial wild rice survey on these water bodies which confirmed the absence of wild rice (see Section 3.1).

### 2.1 Water Quality Monitoring Locations

The water quality monitoring locations are identified in Figure 1. Ox Hide Lake (via Ox Hide Creek), Pickerel Creek, and O'Brien Lake (via O'Brien Creek) discharge into the main body of Swan Lake. Snowball Lake (via Snowball Creek) discharges to the Swan River immediately downstream of where Swan Lake discharges to the Swan River west of monitoring location KSW6. Monitoring location KSW7 is located in a shallow (approximately 2- to 3-feet deep) unnamed bay at the southwest corner of Swan Lake near the outlet to the Swan River. The bay, further referred to in this report as Swan Lake Southwest Bay, is attached to the main body of Swan Lake by a small channel. There are no other substantial inlets or outlets to Swan Lake Southwest Bay.

### 2.2 Water Quality Monitoring Methodology

Water quality monitoring on Swan Lake was conducted by Barr Engineering on behalf of Essar in 2010. Water samples were collected from water surface at all locations on Swan Lake, and at 4-meter depth intervals at KSW5. Water quality monitoring on Ox Hide Lake, Snowball Lake, O'Brien Lake, and Pickerel Creek was conducted by Braun Intertec on behalf of Essar. Water samples were placed on ice and shipped to Braun Intertec's laboratory in Minneapolis for analyses of sulfate, iron, calcium, and magnesium. Water quality analyses consisted of unfiltered sulfate analysis by ion chromatography method (EPA 9056) and unfiltered total iron, total calcium, and total magnesium analysis (EPA 6010B). Temperature, pH, dissolved oxygen, and ORP were measured with a field probe (YSI® model 556 multiprobe or equivalent). Field parameters were collected at 2-meter intervals in Swan Lake at location KSW5.

## 2.3 Water Quality Monitoring Results

Results of 2010 sulfate, iron, calcium, and magnesium analyses are summarized in Table 1. Field parameter measurements (temperature, pH, dissolved oxygen, and ORP) are included as Appendix A. In addition to water quality data collected in 2010, 2009 water quality data for Swan Lake are also included (U. S. Steel Corporation Keetac Expansion Project's EIS, *2009 Water Quality, Hydrology, and Wild Rice Monitoring Year End Report*. Data tables summarizing water quality from that 2009 report are included as Appendix B.

To date, sulfate concentrations in surface samples collected in 2010 from the main body of Swan Lake (KSW4, KSW5, and KSW6) have ranged from 18 mg/L to 31 mg/L, and concentrations in Swan Lake Southwest Bay (KSW7) have ranged from 4.8 mg/L to 9.9 mg/L. Sulfate concentrations in Swan Lake from 2009 to present are presented in Figure 2. The ion chromatography analytical method has an error range of 20 percent according to the method documentation, as represented by error bars included on Figure 2.

On two separate occasions, laboratory results for a sample collected on Swan Lake came back with unusually high sulfate concentrations that were inconsistent with sulfate concentrations of other Swan Lake samples collected on the same date: sample "KSW5-4m" collected on 6/10/2010 and "KSW6" collected on 6/25/2010. The laboratory re-analyzed the samples in question, along with several other samples from the same sampling events. In both cases, sulfate results on the re-analysis were within expected ranges and more closely matched sulfate concentrations of Swan Lake samples collected on the same date. Results from other samples that were re-analyzed closely matched the results of the initial analyses. The laboratory believes the unusually high sulfate results in the two samples in question were the result of contaminated sample vials used to feed samples into the ion chromatography analytical machine. The laboratory has since added procedures to rinse the sample vials with clean laboratory water before using it for ion chromatography analyses. No unusual sulfate results have occurred since the laboratory adopted the additional procedure. The laboratory delivered revised reports for samples collected on 6/10/2010 and 6/25/2010 that utilize results from the re-analysis of sulfate.

## 2.4 Historic Sulfate Concentrations for Swan Lake

Swan Lake has been monitored for sulfate concentrations in previous years by Minnesota Steel/Essar Steel in 2005, 2006, and 2007. Appendix C includes a figure of historic sulfate data collected from the surface of Swan Lake from 2005 through 2009.

---

## 3.0 Wild Rice Survey

The purpose of the Wild Rice Survey is to determine the presence of wild rice (*Zizania palustris* L, known as *Manoomin* in Ojibwe), an annual grass, on Ox Hide Lake, Snowball Lake, O'Brien Lake, Pickerel Creek, Swan Lake Southwest Bay, and the Swan River, which flows out of Swan Lake just north of its Southwest Bay (Figure 1) (Study Area). Since wild rice populations oscillate over an approximate 4- to 6-year period, the following analyses and ground surveys were performed to determine past and current presence of wild rice.

1. Literature search to identify if there were historical records of wild rice on the waterbodies potentially affected by the Essar Project.
2. On-the-ground verification of the presence of wild rice and sampling of the density of select wild rice stands.
3. Analysis of historic infra-red USGS photographs for the presence of wild rice in water bodies potentially affected by the Essar Project.

### 3.1 Initial Wild Rice Survey

An initial wild rice survey was conducted by Barr to determine whether wild rice was present on Ox Hide Lake, Snowball Lake, O'Brien Lake and Pickerel Creek (Figure 3) on the following dates:

O'Brien Lake – July 20, 2010

Ox Hide Lake and Snowball Lake – July 21, 2010

Pickerel Creek – July 21, 2010 and July 30, 2010

Field reconnaissance for the initial survey of O'Brien Lake, Ox Hide Lake and Snowball Lake was conducted on the water surface by boat and on Pickerel Creek by foot. No wild rice was observed on any of these water bodies.

### 3.2 Wild Rice Survey Methodology

The following section describes the methodologies used in obtaining information and data on wild rice.

### **3.2.1 Methodology of Literature Search for Wild Rice in Downstream Receiving Waters from the Project**

To determine which water bodies downstream of the Essar Project might potentially have wild rice populations, a literature review of historic and cultural information was conducted. Information examined included the 2008 DNR “Natural Wild Rice in Minnesota” Report, U.S. Department of Interior Geological Survey maps (Topo maps), Trygg maps, and the 2010 Wild Rice Management Workgroup “350 Significant Wild Rice Waters in Minnesota.” The Trygg maps were developed by J. William Trygg (1966) utilizing data from the original Government Land Surveys along with other historical surveys and sources (<http://www.trygglandoffice.com/maps.html>). The MNDNR was also contacted by Essar in December, 2009 regarding historical wild rice records. The Wild Rice Management Workgroup is a coalition of federal, state, tribal resource managers and other wild rice stakeholders. The list is periodically updated as was last updated May 4, 2010 (Appendix D).

### **3.2.2 Methodology of Historic Aerial Photographic Imagery Analysis**

Staff from the Sciences and Technologies Branch USGS-BRD-Upper Midwest Environmental Sciences Center in La Crosse, WI analyzed 2004 and 2008 1-meter resolution NAIP (National Agricultural Imagery Program) natural color and color infrared aerial photographic imagery for the presence of wild rice on Swan Lake Southwest Bay and Swan River in 2009. In 2009, wild rice appeared in some of the same locations as those identified in NAIP photographs, but the results were inconsistent with ground surveys and therefore their results inconclusive.

According to USGS staff in follow up phone conversations in 2009, wild rice can be identified with approximately 80 percent certainty under the following conditions: (1) 0.5-meter resolution or better; (2) use of stereo-scope and infra-red photography; (3) density of wild rice approximately 30 percent coverage or greater (density factor 2 through 5); and (4) no more than two species growing next to or mixed in with wild rice. Until this technology improves (includes greater accuracy in identifying wild rice at smaller densities (less than 30 percent)), aerial photographic analysis should not replace ground surveys. As a result, Barr decided not to conduct aerial photographic analysis, but carried out the ground surveys in 2010.

### **3.2.3 Methodology of Ground Verification and Density/Acreage Calculations**

Surveys to estimate wild rice density and crop acreage were carried out the week of August 16, 2010. Qualitative estimates of wild rice coverage were carried out by canoeing along the perimeter of the wild rice beds and recording bed locations using a Trimble® GPS Pathfinder® ProXH™ receiver. Quantitative estimates of wild rice coverage were determined from representative sampling grids 10-

meter x 10-meter size. Four grids were sampled on Swan Lake Southwest Bay in 2009 and again in 2010. A grid will be set up the week of September 7, 2010 on Swan River (Figure 6). As in 2009, a 0.5 m<sup>2</sup> PVC square was placed on the water surface at each randomly selected plot and the rice stems within the 0.5 m<sup>2</sup> square were counted. Height above the water surface was measured for five plants within each 0.5 m<sup>2</sup> plot. Height was measured to the plant's highest point (seed head). Stem count sum, mean, median, and standard deviation were calculated based on the stem count for 20 plots. The total stem count for each grid comprises 10 percent of the grid area. The total area sampled for each grid was 10 m<sup>2</sup> (20 plots x 0.5 m<sup>2</sup> each).

### **3.2.4 Methodology of Plant Sampling**

Additional data to determine differences between plant growth and production within the Study Area were collected. Ten wild rice plants were collected from each grid on Swan Lake Southwest Bay and will be collected from the grid on the Swan River. If sparse stands of wild rice were found in sampling locations, then between 5 to 10 plants were collected in the densest locations. Total plant biomass, root biomass, seed biomass, and seed number will be measured. Basic statistical calculations will be carried out (Table 2 – placeholder).

## **3.3 Wild Rice Survey Results**

The following details the results of the wild rice survey and analyses that have been conducted for Swan Lake Southwest Bay and the Swan River up to the dam (Figures 4 - 6).

### **3.3.1 Results from Literature Review**

No evidence from literature cited in 3.1.1 or other literature resulted in identification of wild rice presence on Snowball Lake, Ox Hide Lake, O'Brien Lake or Pickerel Creek. In a December 29, 2009 e-mail from Mr. Rian Reed of the MNDNR, it was stated that he had reviewed historic MNDNR Fisheries Lake Surveys to determine if wild rice (*Zizania aquatica*) occurred in any of the aquatic plant surveys for Snowball and Ox Hide Lakes. Aquatic plant surveys were taken on Snowball Lake (31- 108) in August 1977 and on Ox Hide Lake (31-106) on 06/26/1978. No wild rice was noted in any of these surveys.

In addition, no wild rice was subsequently found in the initial survey on those water bodies. As discussed in the *2009 Water Quality, Hydrology, and Wild Rice Monitoring Report* for the Keetac Expansion Project, Swan Lake Southwest Bay and Swan River were identified as potential wild rice water bodies.

### **3.3.2 Results of Ground Verification and Density/Acreage Calculations**

Wild rice was identified from ground surveys performed on Swan Lake Southwest Bay and Swan River the week of August 16, 2010 (Figures 4 - 6). The four grids established on Swan Lake Southwest Bay in 2009 were counted the week of August 16, 2010. Swan Lake Southwest Bay had the largest overall acreage of wild rice, while Swan River had less acreage but one very dense stand of wild rice near the dam (Figure 4). A grid was set up on September 10, 2010 in the Swan River (grid 43). Wild rice stands were identified along more than 90 percent of the perimeter of Swan Lake Southwest Bay (Figures 5 and 6). Average plant heights for grids 6 and 7 were 50 and 60 percent taller, respectively, than average plant heights in 2009. Average plant heights for grids 8 and 9, however, were 90 and 82 percent the average height of plants from 2009. Many of the wild rice beds observed in the center of Swan Lake Southwest Bay were populated with between 30 to 75 percent lily pads. Detailed information on results of the on-the-ground wild rice survey is included in Appendix E. Photographs of wild rice taken from Swan Lake Southwest Bay and Swan River are included in Appendix F.

### **3.3.3 Results of Plant Density and Seed Calculations**

[TBA]

## **3.4 Wild Rice Survey Discussion**

Results from the 2010 ground surveys identified the presence of wild rice on Swan Lake Southwest Bay and Swan River. Although wild rice has been documented and several dense stands have been identified for two years on these water bodies, it is difficult to determine the health and history of wild rice in these lakes. Delays in plant nutrient uptake and wild rice tissue chemistry influence wild rice growth and production from year to year (Walker et al., 2006; Walker et al., 2010). Other factors such as water level may also play a role, but no data has been collected over multiple years and published. Other factors such as water level may also play a role, but no data has been collected over multiple years and published.

Grids 6 and 7 had 537 and 524 stems respectively with a mean stem density of 27 and 26 stems/0.5 m<sup>2</sup> respectively. Grids 8 and 9 had 187 and 174 stems with a mean stem density of 9 stems each/0.5 m<sup>2</sup>. The mean stem density for all four grids was 18. Grid 43 had 1713 stems with a mean stem density 86 stem/ 0.5 m<sup>2</sup>. Sulfate concentrations measured at KSW7 in Swan Lake Southwest Bay in 2010 have ranged from 4.8 mg/L to 9.9 mg/L. Additional information will be added regarding plant and seed density data. From two year's data examining wild rice density data and water sulfate levels, it is not possible to determine the effects of sulfate on wild rice growth and production.

Notes

- Sulfate Concentration of sulfate in mg/L.
- Fe Total iron concentration, in mg/L.
- Ca Total calcium concentration, in mg/L.
- Mg Total magnesium concentration, in mg/L.
- Tot. Har. Total hardness, in mg/L CaCO<sub>3</sub>.
- NA Not Analyzed
- 24 \* Concentration is a result of re-analysis after initial result was determined to be an error. Prior result was 39 mg/L sulfate.
- 21 \*\* Concentration is a result of re-analysis after initial result was determined to be an error. Prior result was 86 mg/L sulfate.

Notes

mg/L is milligrams per Liter

°C is degrees Celcius

mS/cm is milliSiemens per centimeter

mV is milliVolts

- Notes
- Concentrations of Iron and Sulfate are in mg/L.  
Sulfate results are for ion chromatography method only.
- 11.1 Value is an average of six surface samples collected from various locations in Swan Lake Southwest Bay.
- J Detected but below the Method Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
- NS Not sampled.

**2010 Wild Rice Management Workgroup  
“350 Significant Wild Rice Waters in Minnesota”  
(updated on May 4, 2010)**

350 Significant Wild Rice Waters in Minnesota

This is a list of 350 of the most important wild rice waters in Minnesota based on harvest, ecological, and/or cultural and historical values. Please note that all waters supporting wild rice are important, and a complete inventory of these waters in Minnesota is also maintained. The complete list of wild rice waters should be consulted when appropriate (considerations for zoning, surface water use, water quality and quantity, etc.). This list was compiled by the Wild Rice Management Workgroup, a coalition of federal, state, and tribal resource managers and other wild rice stakeholders. This list may be updated in the future as needed by the Workgroup. list updated 5/4/2010
