**Re: 2010 Wild Rice Report  
Mesabi Nugget Phase II Project**

Dear Mr. Rosenberger,

On behalf of Mesabi Mining, LLC, enclosed is the 2010 Wild Rice Survey and Sulfate Monitoring. The purpose of this report is to determine the location of wild rice (*Zizania palustris* L.) stands downstream from the Project for which surveys were not carried out in 2009. The Study Area includes the St. Louis River from its confluence with the Partridge River to the Fond du Lac Dam and Second Creek from just south of the Tailings Basin to the start of the 2009 survey. This report is being submitted at the request of the MPCA to aid in the EIS and NPDES permitting and represents the final wild rice report to be submitted as part of the Phase II Project.

Please address any questions and comments directly to Keith Hanson at 218-529-8222 or via email at [khanson@barr.com](mailto:khanson@barr.com).

Sincerely,

A handwritten signature in black ink that reads "Keith E. Hanson".

Keith E. Hanson  
Senior Consultant

Enclosure

# 1.0 Summary of Findings

---

The purpose of this report is to determine the location of wild rice (*Zizania palustris* L.) stands downstream from the Project for which surveys were not carried out in 2009. The Study Area includes the St. Louis River from its confluence with the Partridge River to the Fond du Lac Dam and Second Creek from just south of the Tailings Basin (A) to the start of the 2009 survey (downstream of B).

The results from the 2010 ground surveys identified the presence of wild rice along the St. Louis River downstream of its confluence with the Partridge River (Figure 1). The sulfate level of the water sample taken in the location where rice was densest (density factor 2) was 113 mg/L (Table 1-1). Several sparse stands of wild rice (density factor 1) were identified approximately 500 and 1000 feet, respectively, downstream of Highway 100. Sulfate levels along the St. Louis River ranged from 29.6 to 113 mg/L.

**Table 1-1 Sulfate Concentrations along the St. Louis River**

Map Location	Sample Name	Sulfate Concentration (mg/L)
WS-1	PM-STL-KDM-01	113
WS-2	PM-STL-KDM-02	53.2
WS-3	PM-STL-KDM-03	49.4
WS-4	PM-STL-KDM-04	44.7
WS-5	PM-STL-KDM-05	47.4
WS-6	PM-STL-KDM-06	59.4
WS-7	MN-STL-MRB2-D	29.8
WS-8	MN-STL-MRB2-C	31.2
WS-9	MN-STL-MRB2-B	29.6

A small stand of wild rice was identified along Second Creek in 2009 and 2010 at its confluence with the Partridge River (Figure 2). The majority of Second Creek was surveyed in mid- September 2009. The remaining portion upstream from the 2009 survey was completed in 2010. Reported in 2009, the average sulfate concentration at Highway 110 (just downstream from Second Creek on the Partridge River) was 164 mg/L.

Additional monitoring data (not limited to sulfate concentrations and wild rice density) would be needed in order to begin assessing the effects of sulfate on wild rice growth and production and the

relative importance of other factors affecting wild rice density (e.g., hydrologic, weather, and ecological factors) (see Walker et al., 2010).

It is difficult to determine the health and history of wild rice in these waterbodies without a multi-year combined analysis of ground surveys as wild rice populations oscillate over an approximate 4- to 6- year period. Delays in plant nutrient uptake and wild rice tissue chemistry influence wild rice growth and production from year to year (Walker et al., 2006; Walker et al., 2010). Other factors such as water level, parasites, herbivory, and weather conditions may also play a role, but no data has been collected over multiple years and published. Given that wild rice populations fluctuate over a multiple year time period, studies carried out over a shorter time period may not provide sufficient data to begin to determine the factors affecting the growth and production of wild rice. Studies carried out over too short a time period also make it difficult to determine the relative importance of sulfate compared to other factors on wild rice growth and production.

## 2.0 Background

---

The purpose of this report is to provide information in response to the Minnesota Pollution Control Agency's (MPCA) "Wild Rice Information Request" on May 28, 2009 with regard to the Mesabi Mining, LLC (Referred to as Mesabi Nugget) Phase II Project (Project) (see "2009 Wild Rice Survey and Sulfate Monitoring" report prepared for Mesabi Mining).

The MPCA requested the following information:

- A literature review to identify water bodies which could potentially support wild rice downstream from the Project. As a result of this literature review, an analysis of historic infra-red USGS photographs for the presence of wild rice in water bodies downstream from the Project was determined to be beneficial;
- Consultation with Bands of Chippewa and the 1854 Treaty Authority;
- A ground survey of wild rice presence and density;
- Information on current sulfate concentrations in the bodies of water where wild rice was identified.

In 2009, as part of consultation with the Bands of Chippewa (Bands), Mesabi Mining contacted representatives from Bois Forte Band of Chippewa, Fond du Lac Band of Lake Superior Chippewa, Grand Portage Band of Lake Superior Chippewa, and the 1854 Treaty Authority. Representatives from these bands and the 1854 Treaty Authority provided feedback in 2009. Water bodies that were not sampled in 2009, but which were thought to be potential discharge waters downstream from the Project, were sampled in 2010. These included the entire reach of the St. Louis River from its confluence with the Partridge River and a portion of Second Creek not sampled in 2009.

Historic and current infra-red USGS photographs were not analyzed in 2010. Based on results from 2009, the USGS photographs did not provide accurate information regarding the presence or density of wild rice. Therefore this analysis was not included in 2010.

## 3.0 Wild Rice Survey

---

The purpose of the Wild Rice Survey is to determine the presence and density of wild rice (*Zizania palustris* L, known as *Manoomin* in Ojibwe), an annual grass, on the St. Louis River downstream from its confluence with the Partridge River and on Second Creek (Figures 1 and 2). Since wild rice populations oscillate over an approximate 4- to 6- year period, the following analyses and ground surveys were performed to determine past and current presence of wild rice:

- Literature review to identify water bodies which could potentially support wild rice downstream from the Project and
- On-the-ground verification of the presence and density of select wild rice stands.

### 3.1 Wild Rice Survey Methodology

The following section describes the methodologies used in obtaining information and data on wild rice.

#### 3.1.1 Methodology of Literature Review for Wild Rice in Downstream Receiving Waters from the Project

To determine which water bodies downstream of the Project might potentially have wild rice, a literature review of historic and cultural information was conducted in 2009 and 2010. Information examined includes the 2008 DNR “Natural Wild Rice in Minnesota” Report, U.S. Department of Interior Geological Survey maps (Topographic maps), personal communication with the 1854 Treaty Authority, and the 2010 Wild Rice Management Workgroup’s “350 Significant Wild Rice Waters in Minnesota.” The Wild Rice Management Workgroup is a coalition of federal, state, tribal resource managers and other wild rice stakeholders. The list is periodically updated and was last updated May 4, 2010 (Appendix B).

#### 3.1.2 Methodology of Ground Verification and Density/Acreage Calculations

Surveys to estimate wild rice density and crop acreage were carried out in July, August, and September 2010. The same methods described in the “2009 Wild Rice Survey and Sulfate Monitoring” report for Mesabi Mining were followed in 2010. Table 3-1 provides information regarding the wild rice density classification and percent coverage.

**Table 3-1 Wild Rice Density Scale**

<b>Wild Rice Density Classification</b>	<b>Description</b>
1	<10% Wild Rice Coverage
2	10 – 25 % Wild Rive Coverage
3	25 – 50 % Wild Rice Coverage
4	50 – 75% Wild Rice Coverage
5	>75% Wild Rice Coverage

## **3.2 Wild Rice Survey Results**

The following sections present the results of the wild rice literature review and survey for the Study Area. Ground surveys along the St. Louis River were carried out from July 26 – 30, 2010 and from August 24-27, 2010. A ground survey of Second Creek downstream of B (see Figure 2) was carried out in mid- September 2009 and upstream of B on September 9, 2010.

### **3.2.1 Results of 2009 Literature Review**

Below is an examination of the literature regarding the potential presence of wild rice along the St. Louis River. According to Minnesota Rules Chapter 7050.0470, sections of the St Louis River upstream of the Study Area are classified as wild rice waters. While no wild rice was identified within the Study Area, a ground survey was carried out in order to determine from ground reconnaissance whether rice was present.

- Section 2.0, page 3 of the “2009 Wild Rice Survey and Sulfate Monitoring” report prepared for Mesabi Mining provides determination of the Study Area as a result of consultation with Bois Forte Band of Chippewa, Fond du Lac Band of Lake Superior Chippewa, Grand Portage Band of Lake Superior Chippewa, and the 1854 Treaty Authority (Barr, 2009).

“... Feedback was received from 1854 Authority’s Darren Vogt on July 10, 2009 confirming that Mesabi Mining proposed study area included water bodies with potential for the presence of wild rice stands. Mr. Vogt mentioned the St. Louis River, including several sites upstream from its confluence with the Partridge River. After a follow-up phone call, Mr. Vogt agreed that those sites were outside the scope of waters potentially affected by discharge waters. Mr. Vogt also sent Mesabi Mining a picture of wild rice stands near Highway 110 on the Partridge River dated July 29, 2009. Three grid density calculations were made in that location. After follow up emails and phone calls to representatives of the three bands, they said that they did not have any additional input beyond what Mr. Vogt provided.”

- The 2010 Wild Rice Management Workgroup’s “350 Significant Wild Rice Waters in Minnesota” identifies several reaches of the headwaters of the St. Louis River as historically supporting wild rice (similar to information provided by Darren Vogt in personal communication above). It does not, however, mention reaches of the river within the Study Area.
- Page 104 of the MnDNR *Investigational Report #69: A Biological Survey and Fishery Management plan for the Streams of the Saint Louis River Basin* (Moyle and Kenyon, 1947) includes discussion of the presence of wild rice in two rivers which flow into the St. Louis River. These rivers, however, are not part of the mainstem of the St. Louis River. The report reads: “Historic presence of wild rice in the St. Louis River Basin. #38. Zizania aquatica L., wild rice. – Rare in most of the streams; most common in the western portion of the [St. Louis] drainage basin. The most extensive stands are in the Floodwood and Swan River drainage basins.”
- The MnDNR, Section of Fisheries “Completion Report: A Study of the St. Louis River” identified wild rice in three locations along the upper St. Louis River: downstream from Seven Beaver Lake at river miles 187 to 189, 176 and 165. Pages 25 – 27 include narrative description of its presence. Within the Habitat Assessment section, River Mile 188.7 it was noted, “...Wild rice was extensive and extended from the shore to a depth of three to four feet.” At River Mile 171.0 it was noted, “Wild rice beds dominated this reach, with a deeper channel down the center, but no distinct shoreline.” These locations, however, were not within the Study Area.

### **3.2.2 Results of Ground Verification and Density/Acreage Calculations**

Wild rice was identified from ground surveys performed on the St. Louis River just downstream of its confluence with the Partridge River. Wild rice was not identified along Second Creek (Figures 1 and 2). The densest stand of wild rice (density factor 2) was identified just upstream from Highway 100, with dimensions of approximately 15 feet x 80 feet (see photograph A-1). The stand was not dense enough, however, to carry out grid sampling. Several sparse stands of wild rice (density factor 1) were identified approximately 500 and 1000 feet respectively downstream of Highway 100 (Figure 1 and Photographs A-1, A-2, and A-3).

## 4.0 Sulfate Monitoring

Sulfate monitoring was carried out during wild rice surveying in 2010. This data is included in Table 1-1 and below along with data collected in from 2008 and 2009.

### 4.1 Sulfate Monitoring – 2009 and 2010 Data

Results of sulfate analyses performed on water samples collected during wild rice surveys are presented in Table 4-1. Nine water samples were collected along the St. Louis River in 2010. One sample was collected in the location where wild rice was found (WS-1) (Table 1-1). Additional sampling was carried out in locations comparable to locations sampled by Lindgren et al. 2006.

**Table 4-1 Comparison of Sulfate Concentrations and Water Depth at Wild Rice Stands in 2009 and 2010<sup>1</sup>**

Water Body	# Samples	Sulfate Concentration (mg/L)			Water Depth (in) Mean
		Mean	Std. Dev.	Range	
St. Louis River 2010	9	50.9	25.7	29.6 - 113	14
Pokegama Bay 2009	4	7.6	0.8	7.0 - 8.8	23
St. Louis River 2009	6	17.7	7.4	8.0 - 27.4	15

All water samples were analyzed for sulfate using an ion chromatography method (EPA 300.0). More detailed results of the 2009 data are included in the “2009 Wild Rice Survey and Sulfate Monitoring” report prepared for Mesabi Mining.

### 4.2 Sulfate Monitoring - Baseline Data

Sulfate concentrations have been measured at one location along the Partridge River at the Highway 110 bridge crossing (MNSW12) and one location on Second Creek just before its confluence with the Partridge River (MNSW8) since 2008 as part of an ongoing water quality monitoring program for the Mesabi Nugget Phase II Project (see Figure 1 of “2009 Wild Rice Survey and Sulfate Monitoring” report). An additional water quality monitoring station on the Partridge River just downstream of the Colby Lake outlet (MNSW14) was established in June 2009. Additional samples were taken at MNSW14 monthly from August to December 2009 and included in this report. These data are summarized in Table 4-2.

---

<sup>1</sup> Two water depths were measured at locations where wild rice was identified in 2010. The water depth for the St. Louis River 2010 is the mean of those two values.

**Table 4-2 Sulfate Monitoring Data Partridge and Second Creek<sup>2</sup>**

<b>Monitoring Station</b>	<b>Water Body</b>	<b>Location</b>	<b>Monitoring Period</b>	<b>Average (mg/L)</b>	<b>Std. Dev. (mg/L)</b>	<b>Min. (mg/L)</b>	<b>Max. (mg/L)</b>
MNSW14	Partridge River	Below Colby Lake outlet	June – December 2009	49.2	18.3	28.7	72.6
MNSW12	Partridge River	At Highway 110	May 2008 - August 2009	164	103	43.0	302
MNSW8	Second Creek	Near outlet to Partridge River	May 2008 - August 2009	474	111	269	624

As discussed in the “2009 Wild Rice Survey and Sulfate Monitoring” report, measured concentrations of sulfate in the Partridge River were greatest at the most downstream monitoring location (MNSW12), averaging 164 mg/L and ranging from 43.0 mg/L to 302 mg/L. For the same period of record (May 2008 to August 2009), sulfate concentrations in Second Creek averaged 474 mg/L and ranged from 269 mg/L to 624 mg/L.

More recent data from upstream of the Second Creek confluence (MNSW14, from June to December 2009) confirm that sulfate concentrations in the Partridge River above Second Creek are relatively low. For this period of record, sulfate concentrations downstream of the Colby Lake outlet averaged 49.2 mg/L and ranged from 28.7 mg/L to 72.6 mg/L.

---

<sup>2</sup> Additional sulfate data was collected monthly from September to December 2009 at MNSW14. The average, standard deviation, minimum, and maximum values were recalculated accordingly.

## 5.0 Wild Rice Summary

---

Results from 2010 ground surveys identified the presence of wild rice in three locations on the St. Louis River within several thousand feet of its confluence with the Partridge River. Wild rice beds upstream of the Partridge River confluence had a density factor of two (10 to 25%). Wild rice beds downstream of the Partridge River were small and sparse, having a density factor of one (less than 10%). Wild rice was not found along the remaining reach of the St. Louis River (up to Fond du Lac Dam), nor along Second Creek. The sulfate concentration from one grab sample at the location of wild rice on the St. Louis was 113 mg/L. Sulfate concentrations downstream from that location to the Fond du Lac Dam ranged from 29.6 to 59.4 mg/L.

It is difficult to determine the health and history of wild rice in these water bodies without a multi-year combined analysis of ground surveys as wild rice populations oscillate over an approximate 4- to 6-year period. Delays in plant nutrient uptake and wild rice tissue chemistry influence wild rice growth and production from year to year (Walker et al., 2006; Walker et al., 2010). Other factors such as water level, parasites, herbivory, and weather conditions may also play a role, but no data has been collected over multiple years and published. Given that wild rice populations fluctuate over a multiple year time period, studies carried out over a shorter time period (one year) may not provide sufficient data to begin to determine the factors affecting the growth and production of wild rice. Studies carried out over too short a time period also make it difficult to determine the relative importance of sulfate compared to other factors on wild rice growth and production.

Additional monitoring data (not limited to sulfate concentrations and wild rice density) would be needed in order to begin assessing the effects of sulfate on wild rice growth and production. Such monitoring data should include analysis of other water and sediment anion and cation concentrations, plant and seed biomass and plant nutrient content, to name several of the most commonly measured. Such data is also important in order to determine the effects of sulfate relative to other factors on the growth and production of wild rice.

### **2010 Wild Rice Management Workgroup's "350 Significant Wild Rice Waters in Minnesota"**

### 350 Significant Wild Rice Waters in Minnesota

This is a list of 350 of the most important wild rice waters in Minnesota based on harvest, ecological, and/or cultural and historical values.

Please note that all waters supporting wild rice are important, and a complete inventory of these waters in Minnesota is also maintained. The complete list of wild rice waters should be consulted when appropriate (considerations for zoning, surface water use, water quality and quantity, etc.).

This list was compiled by the Wild Rice Management Workgroup, a coalition of federal, state, and tribal resource managers and other wild rice stakeholders. This list may be updated in the future as needed by the Workgroup.
